

Q-245 \rightarrow ~~into~~ into the binary.

2	45	1	\Rightarrow	101101
2	22	0		
2	11	1		
2	5	1		
2	2	0		
	1			

 \Rightarrow Hence the binary of the 45 is 101101 \Rightarrow & Hexadecimal of the 45 is 2d

$$\underbrace{10}_2 \quad \underbrace{1101}_d$$

 \Rightarrow Now Circuit of the
 $F = (A \text{ And } B) \text{ or } (\text{not } C)$

(105)

Q-4 Here, we call the NAND & OR Gates as a universal gate because we can make all the gate like AND, OR & Not and others

⇒ Using the NAND Gate we can make every gate.

1) Not Gate

2) AND Gate

3) OR Gate

Q-1

1) Input unit:-

From the Input unit we are give the input to the any code or any program and we give the input to the CPU directly from the Input unit.

EX Keyboard, mouse, projection remotes, ISS Ports.

2) memory unit:-

Here we are store the data which we want to collect.

Here many types of the memory like,
1) RAM, ROM.

Other type of ROM

2) Hard disk, Pen drive, SSD.

3) CPU

In this ~~over~~ our system perform all task & very here, because this is the mind of the computer.

4) output unit

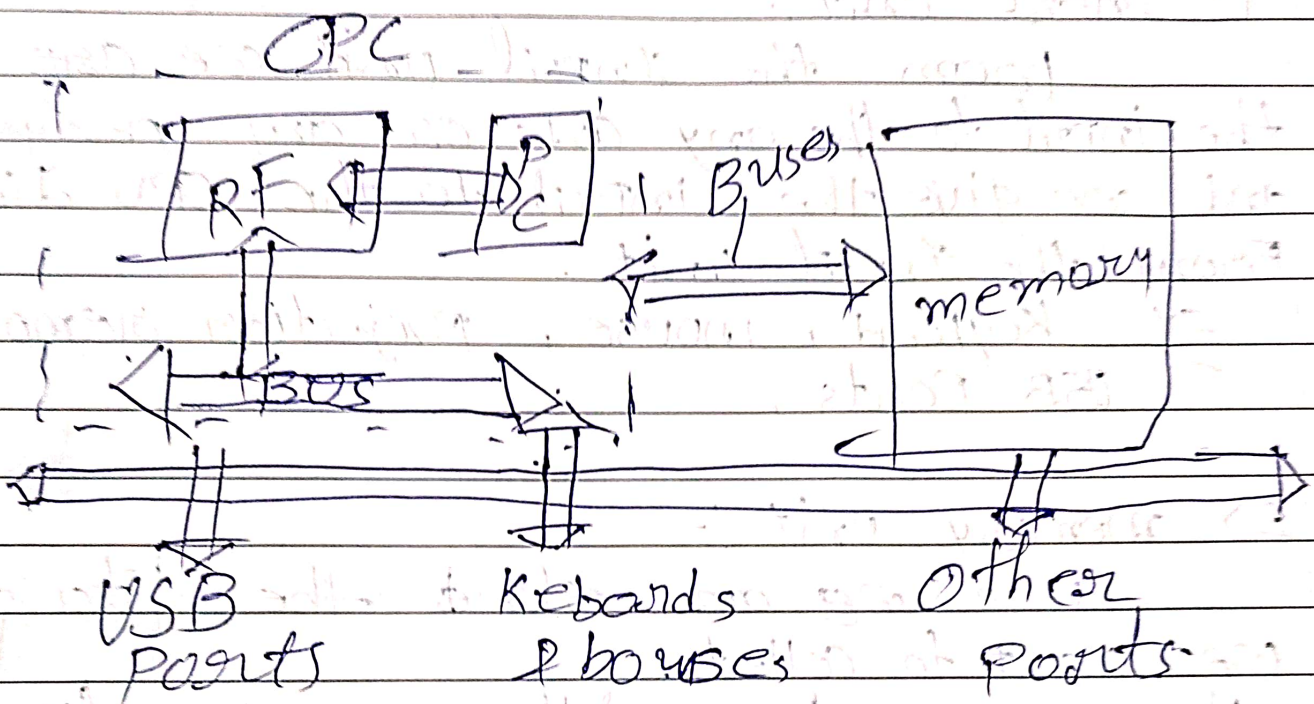

Here we are getting the out put from the CPU.

EX Monitor, speakers, projectors & others.

⇒ two Factors.

1) Size of input.

2) Type of the processor.

⇒ Here

RF ⇒ Register File

memory ⇒ Store the store data

PC ⇒ Program counter

Store the address of RF.

CPU ⇒ combination of RF & PC & Buses

USB ⇒ For Input & Output

& For Key Board & mouse.
